

Statistical Formulas

Descriptive Statistics

Frequencies

Sample size n num of individuals in the sample.
Absolute frequency n_i . (num of x_i in the sample)
Relative frequency $f_i = n_i/n$.
Cumulative absolute freq $N_i = \sum_{k=0}^i n_k$.
Cumulative relative freq $F_i = N_i/n$.

Central tendency statistics

Mean $\bar{x} = \frac{\sum x_i n_i}{n}$.
Median me The value with cum.rel.freq. $F_{me} = 0.5$.
Mode mo The most frequent value.

Position statistics

Quartiles Q_1, Q_2, Q_3 divide the distribution into 4 equal parts. Their cum.rel.freqs. are $F_{Q_1} = 0.25$, $F_{Q_2} = 0.5$ and $F_{Q_3} = 0.75$.
Percentiles P_1, P_2, \dots, P_{99} divide the distribution into 100 equal parts.
 The cum.rel.freq. is $F_{P_i} = i/100$.

Dispersion statistics

Interquartile range $IQR = Q_3 - Q_1$.
Variance $s^2 = \frac{\sum (x_i - \bar{x})^2 n_i}{n} = \frac{\sum x_i^2 n_i}{n} - \bar{x}^2$
Standard deviation $s = \sqrt{s^2}$.
Coefficient of variation $cv = \frac{s}{|\bar{x}|}$.

Shape statistics

Coefficient of skewness $g_1 = \frac{\sum (x_i - \bar{x})^3 f_i}{s^3}$.
Coefficient of kurtosis $g_2 = \frac{\sum (x_i - \bar{x})^4 f_i}{s^4} - 3$.

Standardization

$$z = \frac{x - \bar{x}}{s_x}$$

Regression and correlation

Linear regression

Covariance $s_{xy} = \frac{\sum x_i y_i n_{ij}}{n} - \bar{x}\bar{y}$.
Regression lines :
 $y \text{ on } x: y = \bar{y} + \frac{s_{xy}}{s_x^2}(x - \bar{x})$
 $x \text{ on } y: x = \bar{x} + \frac{s_{xy}}{s_y^2}(y - \bar{y})$
Regression coefficients
 $(y \text{ on } x) b_{yx} = \frac{s_{xy}}{s_x^2} \quad (x \text{ on } y) b_{xy} = \frac{s_{xy}}{s_y^2}$
Coefficient of determination
 $r^2 = \frac{s_{xy}^2}{s_x^2 s_y^2} \quad 0 \leq r^2 \leq 1$
Correlation coefficient
 $r = \frac{s_{xy}}{s_x s_y} \quad -1 \leq r \leq 1$

Non-linear regression

Exponential model $y = e^{a+bx}$
 Apply the logarithm to the dependent variable and compute the line $\log y = a + bx$.
Logarithmic model $y = a + b \log x$
 Apply the logarithm to the independent variable and compute the line $y = a + b \log x$.
Potential model $y = ax^b$
 Apply the logarithm to both variables and compute the line $\log y = a + b \log x$.
